

Mando's Rule Book for Frontside Runners

1. Identify Pre-Run Indicators

- **Delta Volume Increase:** Look for significant **delta volume (buying > selling)**. On multiple charts, a spike in delta volume correlates with a strong move up.
- **Separation of Lorentzian Line:** When the **Lorentzian Line** starts to separate sharply from the price, it often signals a **momentum shift**.
- **Big Volume Incoming:** Large volume spikes indicate institutional interest, often marking the start of the run.
- **Rocket Incoming:** If marked on your chart, this suggests a **momentum ignition**.

2. Entry Signals

- **Buy on Breakout Candle:** A strong bullish candle with volume suggests a breakout.
- **Enter at Retest of Support:** After the initial breakout, stocks often retest the breakout level.
- **Normal Buy Signal:** If the chart marks a buy signal without big volume, it is a safer play but requires confirmation.
- **Enter when Volume Confirms Trend:** If volume remains strong and price stays above the moving average.

3. Exit Strategy

- **Take Partial Profits on Spikes:** Many charts show exits at peak momentum.
- **Monitor for Halt Risks:** A **halt** can prevent exits, so securing profits on the way up is critical.
- **Stop Loss Below Key Levels:** Many charts set **tight stop losses** at previous breakouts or retracement areas.

Best Setup for a Runner

1. Watch for Delta Volume & Big Volume Confirmation.
2. Enter on Breakout or Retest of Support.
3. Sell into Strength (Partial Exits on Momentum Spikes).
4. Manage Risk with Stop Losses at Key Levels.
